

CHAPTER 1

Limits and Their Properties

Section 1.1 A Preview of Calculus

1. Calculus is the mathematics of change. Precalculus is more static. Answers will vary. *Sample answer:*

Precalculus: Area of a rectangle

Calculus: Area under a curve

Precalculus: Work done by a constant force

Calculus: Work done by a variable force

Precalculus: Center of a rectangle

Calculus: Centroid of a region

2. A secant line through a point P is a line joining P and another point Q on the graph.

The slope of the tangent line P is the limit of the slopes of the secant lines joining P and Q , as Q approaches P .

3. Precalculus: $(20 \text{ ft/sec})(15 \text{ sec}) = 300 \text{ ft}$

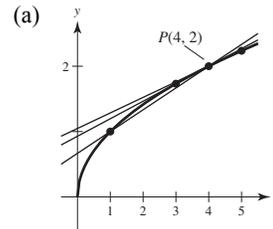

4. Calculus required: Velocity is not constant.

$$\text{Distance} \approx (20 \text{ ft/sec})(15 \text{ sec}) = 300 \text{ ft}$$

5. Calculus required: Slope of the tangent line at $x = 2$ is the rate of change, and equals about 0.16.

6. Precalculus: rate of change = slope = 0.08

7. $f(x) = \sqrt{x}$

(b) slope = $m = \frac{\sqrt{x} - 2}{x - 4}$

$$= \frac{\sqrt{x} - 2}{(\sqrt{x} + 2)(\sqrt{x} - 2)}$$

$$= \frac{1}{\sqrt{x} + 2}, x \neq 4$$

$$x = 1: m = \frac{1}{\sqrt{1} + 2} = \frac{1}{3}$$

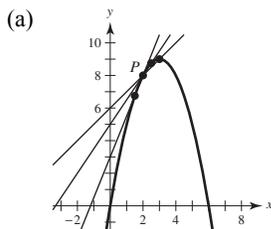

$$x = 3: m = \frac{1}{\sqrt{3} + 2} \approx 0.2679$$

$$x = 5: m = \frac{1}{\sqrt{5} + 2} \approx 0.2361$$

(c) At $P(4, 2)$ the slope is $\frac{1}{\sqrt{4} + 2} = \frac{1}{4} = 0.25$.

You can improve your approximation of the slope at $x = 4$ by considering x -values very close to 4.

8. $f(x) = 6x - x^2$

(b) slope = $m = \frac{(6x - x^2) - 8}{x - 2} = \frac{(x - 2)(4 - x)}{x - 2} = (4 - x), x \neq 2$

For $x = 3, m = 4 - 3 = 1$

For $x = 2.5, m = 4 - 2.5 = 1.5 = \frac{3}{2}$

For $x = 1.5, m = 4 - 1.5 = 2.5 = \frac{5}{2}$

- (c) At $P(2, 8)$, the slope is 2. You can improve your approximation by considering values of x close to 2.

9. (a) $\text{Area} \approx 5 + \frac{5}{2} + \frac{5}{3} + \frac{5}{4} \approx 10.417$
 $\text{Area} \approx \frac{1}{2} \left(5 + \frac{5}{1.5} + \frac{5}{2} + \frac{5}{2.5} + \frac{5}{3} + \frac{5}{3.5} + \frac{5}{4} + \frac{5}{4.5} \right) \approx 9.145$
 (b) You could improve the approximation by using more rectangles.

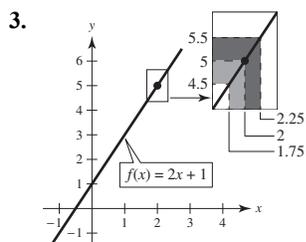

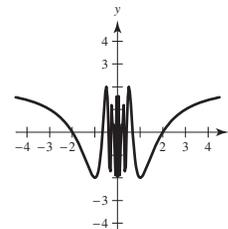

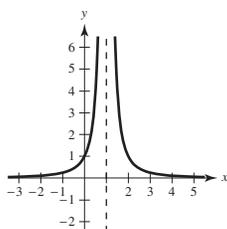

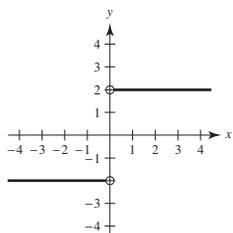

10. Answers will vary. *Sample answer:*

The instantaneous rate of change of an automobile's position is the velocity of the automobile, and can be determined by the speedometer.

11. (a) $D_1 = \sqrt{(5-1)^2 + (1-5)^2} = \sqrt{16+16} \approx 5.66$
 (b) $D_2 = \sqrt{1 + \left(\frac{5}{2}\right)^2} + \sqrt{1 + \left(\frac{5}{2} - \frac{5}{3}\right)^2} + \sqrt{1 + \left(\frac{5}{3} - \frac{5}{4}\right)^2} + \sqrt{1 + \left(\frac{5}{4} - 1\right)^2}$
 $\approx 2.693 + 1.302 + 1.083 + 1.031 \approx 6.11$
 (c) Increase the number of line segments.

Section 1.2 Finding Limits Graphically and Numerically

1. As the graph of the function approaches 8 on the horizontal axis, the graph approaches 25 on the vertical axis.
 2. (i) The values of f approach different numbers as x approaches c from different sides of c :
 (ii) The values of f increase without bound as x approaches c :
 (iii) The values of f oscillate between two fixed numbers as x approaches c :

4. No. For example, consider Example 2 from this section.

$$f(x) = \begin{cases} 1, & x \neq 2 \\ 0, & x = 2 \end{cases}$$

$$\lim_{x \rightarrow 2} f(x) = 1, \text{ but } f(2) = 0$$

5.

x	3.9	3.99	3.999	4	4.001	4.01	4.1
$f(x)$	0.3448	0.3344	0.3334	?	0.3332	0.3322	0.3226

$$\lim_{x \rightarrow 4} \frac{x-4}{x^2-5x-4} \approx 0.3333 \quad \left(\text{Actual limit is } \frac{1}{3} \right)$$

6.

x	2.9	2.99	2.999	3	3.001	3.01	3.1
$f(x)$	0.1695	0.1669	0.1667	?	0.1666	0.1664	0.1639

$$\lim_{x \rightarrow 3} \frac{x-3}{x^2-9} \approx 0.1667 \quad \left(\text{Actual limit is } \frac{1}{6} \right)$$

7.

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$	0.5132	0.5013	0.5001	?	0.4999	0.4988	0.4881

$$\lim_{x \rightarrow 0} \frac{\sqrt{x+1} - 1}{x} \approx 0.5000 \quad \left(\text{Actual limit is } \frac{1}{2} \right)$$

8.

x	2.9	2.99	2.999	3.001	3.01	3.1
$f(x)$	-0.0641	-0.0627	-0.0625	-0.0625	-0.0623	-0.0610

$$\lim_{x \rightarrow 3} \frac{[1/(x+1)] - (1/4)}{x-3} \approx -0.0625 \quad \left(\text{Actual limit is } -\frac{1}{16} \right)$$

9.

x	-0.1	-0.01	-0.001	0.001	0.01	0.1
$f(x)$	0.9983	0.99998	1.0000	1.0000	0.99998	0.9983

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} \approx 1.0000 \quad (\text{Actual limit is } 1.) \quad (\text{Make sure you use radian mode.})$$

10.

x	-0.1	-0.01	-0.001	0.001	0.01	0.1
$f(x)$	0.0500	0.0050	0.0005	-0.0005	-0.0050	-0.0500

$$\lim_{x \rightarrow 0} \frac{\cos x - 1}{x} \approx 0.0000 \quad (\text{Actual limit is } 0.) \quad (\text{Make sure you use radian mode.})$$

11.

x	0.9	0.99	0.999	1.001	1.01	1.1
$f(x)$	0.2564	0.2506	0.2501	0.2499	0.2494	0.2439

$$\lim_{x \rightarrow 1} \frac{x-2}{x^2+x-6} \approx 0.2500 \quad \left(\text{Actual limit is } \frac{1}{4} \right)$$

12.

x	-4.1	-4.01	-4.001	-4	-3.999	-3.99	-3.9
$f(x)$	1.1111	1.0101	1.0010	?	0.9990	0.9901	0.9091

$$\lim_{x \rightarrow -4} \frac{x+4}{x^2+9x+20} \approx 1.0000 \quad (\text{Actual limit is } 1.)$$

13.

x	0.9	0.99	0.999	1.001	1.01	1.1
$f(x)$	0.7340	0.6733	0.6673	0.6660	0.6600	0.6015

$$\lim_{x \rightarrow 1} \frac{x^4 - 1}{x^6 - 1} \approx 0.6666 \quad \left(\text{Actual limit is } \frac{2}{3} \right)$$

14.

x	-3.1	-3.01	-3.001	-3	-2.999	-2.99	-2.9
$f(x)$	27.91	27.0901	27.0090	?	26.9910	26.9101	26.11

$$\lim_{x \rightarrow -3} \frac{x^3 + 27}{x + 3} \approx 27.0000 \quad (\text{Actual limit is } 27.)$$

15.

x	-6.1	-6.01	-6.001	-6	-5.999	-5.99	-5.9
$f(x)$	-0.1248	-0.1250	-0.1250	?	-0.1250	-0.1250	-0.1252

$$\lim_{x \rightarrow -6} \frac{\sqrt{10-x} - 4}{x+6} \approx -0.1250 \quad \left(\text{Actual limit is } -\frac{1}{8} \right)$$

16.

x	1.9	1.99	1.999	2	2.001	2.01	2.1
$f(x)$	0.1149	0.115	0.1111	?	0.1111	0.1107	0.1075

$$\lim_{x \rightarrow 2} \frac{x/(x+1) - 2/3}{x-2} \approx 0.1111 \quad \left(\text{Actual limit is } \frac{1}{9} \right)$$

17.

x	-0.1	-0.01	-0.001	0.001	0.01	0.1
$f(x)$	1.9867	1.9999	2.0000	2.0000	1.9999	1.9867

$$\lim_{x \rightarrow 0} \frac{\sin 2x}{x} \approx 2.0000 \quad (\text{Actual limit is } 2.) \quad (\text{Make sure you use radian mode.})$$

18.

x	-0.1	-0.01	-0.001	0.001	0.01	0.1
$f(x)$	0.4950	0.5000	0.5000	0.5000	0.5000	0.4950

$$\lim_{x \rightarrow 0} \frac{\tan x}{\tan 2x} \approx 0.5000 \quad \left(\text{Actual limit is } \frac{1}{2} \right)$$

19. $f(x) = \frac{2}{x^3}$

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$	-2000	-2×10^6	-2×10^9	?	2×10^9	2×10^6	2000

As x approaches 0 from the left, the function decreases without bound. As x approaches 0 from the right, the function increases without bound.

20. $f(x) = \frac{3|x|}{x^2}$

x	-0.1	-0.01	-0.001	0	0.001	0.01	0.1
$f(x)$	30	300	3000	?	3000	300	30

As x approaches 0 from either side, the function increases without bound.

21. $\lim_{x \rightarrow 3} (4 - x) = 1$

22. $\lim_{x \rightarrow 0} \sec x = 1$

23. $\lim_{x \rightarrow 2} f(x) = \lim_{x \rightarrow 2} (4 - x) = 2$

24. $\lim_{x \rightarrow 1} f(x) = \lim_{x \rightarrow 1} (x^2 + 3) = 4$

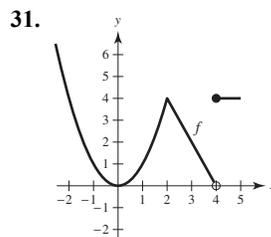

25. $\lim_{x \rightarrow 2} \frac{|x-2|}{x-2}$ does not exist.

For values of x to the left of 2, $\frac{|x-2|}{x-2} = -1$, whereas

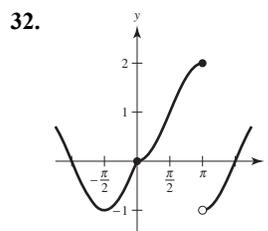

for values of x to the right of 2, $\frac{|x-2|}{x-2} = 1$.

26. $\lim_{x \rightarrow 5} \frac{2}{x-5}$ does not exist because the function increases and decreases without bound as x approaches 5.

27. $\lim_{x \rightarrow 0} \cos(1/x)$ does not exist because the function oscillates between -1 and 1 as x approaches 0 .
28. $\lim_{x \rightarrow \pi/2} \tan x$ does not exist because the function increases without bound as x approaches $\frac{\pi}{2}$ from the left and decreases without bound as x approaches $\frac{\pi}{2}$ from the right.
29. (a) $f(1)$ exists. The black dot at $(1, 2)$ indicates that $f(1) = 2$.
- (b) $\lim_{x \rightarrow 1} f(x)$ does not exist. As x approaches 1 from the left, $f(x)$ approaches 3.5 , whereas as x approaches 1 from the right, $f(x)$ approaches 1 .
- (c) $f(4)$ does not exist. The hollow circle at $(4, 2)$ indicates that f is not defined at 4 .
- (d) $\lim_{x \rightarrow 4} f(x)$ exists. As x approaches 4 , $f(x)$ approaches 2 : $\lim_{x \rightarrow 4} f(x) = 2$.
30. (a) $f(-2)$ does not exist. The vertical dotted line indicates that f is not defined at -2 .
- (b) $\lim_{x \rightarrow -2} f(x)$ does not exist. As x approaches -2 , the values of $f(x)$ do not approach a specific number.
- (c) $f(0)$ exists. The black dot at $(0, 4)$ indicates that $f(0) = 4$.
- (d) $\lim_{x \rightarrow 0} f(x)$ does not exist. As x approaches 0 from the left, $f(x)$ approaches $\frac{1}{2}$, whereas as x approaches 0 from the right, $f(x)$ approaches 4 .
- (e) $f(2)$ does not exist. The hollow circle at $(2, \frac{1}{2})$ indicates that $f(2)$ is not defined.
- (f) $\lim_{x \rightarrow 2} f(x)$ exists. As x approaches 2 , $f(x)$ approaches $\frac{1}{2}$: $\lim_{x \rightarrow 2} f(x) = \frac{1}{2}$.
- (g) $f(4)$ exists. The black dot at $(4, 2)$ indicates that $f(4) = 2$.
- (h) $\lim_{x \rightarrow 4} f(x)$ does not exist. As x approaches 4 , the values of $f(x)$ do not approach a specific number.

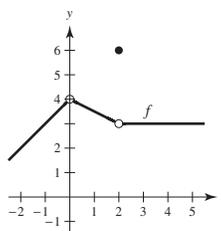

$\lim_{x \rightarrow c} f(x)$ exists for all values of $c \neq 4$.

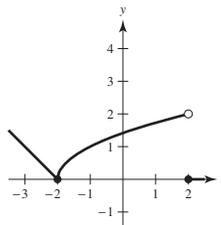

$\lim_{x \rightarrow c} f(x)$ exists for all values of $c \neq \pi$.

33. One possible answer is

34. One possible answer is

35. You need $|f(x) - 3| = |(x + 1) - 3| = |x - 2| < 0.4$.
 So, take $\delta = 0.4$. If $0 < |x - 2| < 0.4$,
 then $|x - 2| = |(x + 1) - 3| = |f(x) - 3| < 0.4$,
 as desired.

36. You need $|f(x) - 1| = \left| \frac{1}{x-1} - 1 \right| = \left| \frac{2-x}{x-1} \right| < 0.01$. Let $\delta = \frac{1}{101}$. If $0 < |x - 2| < \frac{1}{101}$, then

$$\begin{aligned} -\frac{1}{101} < x - 2 < \frac{1}{101} &\Rightarrow 1 - \frac{1}{101} < x - 1 < 1 + \frac{1}{101} \\ &\Rightarrow \frac{100}{101} < x - 1 < \frac{102}{101} \\ &\Rightarrow |x - 1| > \frac{100}{101} \end{aligned}$$

and you have

$$|f(x) - 1| = \left| \frac{1}{x-1} - 1 \right| = \left| \frac{2-x}{x-1} \right| < \frac{1/101}{100/101} = \frac{1}{100} = 0.01.$$

37. You need to find δ such that $0 < |x - 1| < \delta$ implies

$$|f(x) - 1| = \left| \frac{1}{x} - 1 \right| < 0.1. \text{ That is,}$$

$$-0.1 < \frac{1}{x} - 1 < 0.1$$

$$1 - 0.1 < \frac{1}{x} < 1 + 0.1$$

$$\frac{9}{10} < \frac{1}{x} < \frac{11}{10}$$

$$\frac{10}{9} > x > \frac{10}{11}$$

$$\frac{10}{9} - 1 > x - 1 > \frac{10}{11} - 1$$

$$\frac{1}{9} > x - 1 > -\frac{1}{11}$$

So take $\delta = \frac{1}{11}$. Then $0 < |x - 1| < \delta$ implies

$$-\frac{1}{11} < x - 1 < \frac{1}{11}$$

$$-\frac{1}{11} < x - 1 < \frac{1}{9}$$

Using the first series of equivalent inequalities, you obtain

$$|f(x) - 1| = \left| \frac{1}{x} - 1 \right| < 0.1.$$

38. You need to find δ such that $0 < |x - 1| < \delta$ implies

$$|f(x) - 1| = \left| 2 - \frac{1}{x} - 1 \right| = \left| 1 - \frac{1}{x} \right| < \varepsilon.$$

$$-\varepsilon < \frac{1}{x} - 1 < \varepsilon$$

$$1 - \varepsilon < \frac{1}{x} < 1 + \varepsilon$$

$$\frac{1}{1 - \varepsilon} > x > \frac{1}{1 + \varepsilon}$$

$$\frac{1}{1 - \varepsilon} - 1 > x - 1 > \frac{1}{1 + \varepsilon} - 1$$

$$\frac{\varepsilon}{1 - \varepsilon} > x - 1 > \frac{-\varepsilon}{1 + \varepsilon}$$

For $\varepsilon = 0.05$, take $\delta = \frac{0.05}{1 - 0.05} \approx 0.05$.

For $\varepsilon = 0.01$, take $\delta = \frac{0.01}{1 - 0.01} \approx 0.01$.

For $\varepsilon = 0.005$, take $\delta = \frac{0.005}{1 - 0.005} \approx 0.005$.

As ε decreases, so does δ .

39. $\lim_{x \rightarrow 2} (3x + 2) = 3(2) + 2 = 8 = L$

(a) $|(3x + 2) - 8| < 0.01$

$$|3x - 6| < 0.01$$

$$3|x - 2| < 0.01$$

$$0 < |x - 2| < \frac{0.01}{3} \approx 0.0033 = \delta$$

So, if $0 < |x - 2| < \delta = \frac{0.01}{3}$, you have

$$3|x - 2| < 0.01$$

$$|3x - 6| < 0.01$$

$$|(3x + 2) - 8| < 0.01$$

$$|f(x) - L| < 0.01.$$

(b) $|(3x + 2) - 8| < 0.005$

$$|3x - 6| < 0.005$$

$$3|x - 2| < 0.005$$

$$0 < |x - 2| < \frac{0.005}{3} \approx 0.00167 = \delta$$

Finally, as in part (a), if $0 < |x - 2| < \frac{0.005}{3}$,

you have $|(3x + 2) - 8| < 0.005$.

40. $\lim_{x \rightarrow 6} \left(6 - \frac{x}{3}\right) = 6 - \frac{6}{3} = 4 = L$

(a) $\left| \left(6 - \frac{x}{3}\right) - 4 \right| < 0.01$

$$\left| 2 - \frac{x}{3} \right| < 0.01$$

$$\left| -\frac{1}{3}(x - 6) \right| < 0.01$$

$$|x - 6| < 0.03$$

$$0 < |x - 6| < 0.03 = \delta$$

So, if $0 < |x - 6| < \delta = 0.03$, you have

$$\left| -\frac{1}{3}(x - 6) \right| < 0.01$$

$$\left| 2 - \frac{x}{3} \right| < 0.01$$

$$\left| \left(6 - \frac{x}{3}\right) - 4 \right| < 0.01$$

$$|f(x) - L| < 0.01.$$

(b) $\left| \left(6 - \frac{x}{3}\right) - 4 \right| < 0.005$

$$\left| 2 - \frac{x}{3} \right| < 0.005$$

$$\left| -\frac{1}{3}(x - 6) \right| < 0.005$$

$$|x - 6| < 0.015$$

$$0 < |x - 6| < 0.015 = \delta$$

As in part (a), if $0 < |x - 6| < 0.015$, you have

$$\left| \left(6 - \frac{x}{3}\right) - 4 \right| < 0.005.$$

41. $\lim_{x \rightarrow 2} (x^2 - 3) = 2^2 - 3 = 1 = L$

(a) $|(x^2 - 3) - 1| < 0.01$

$$|x^2 - 4| < 0.01$$

$$|(x + 2)(x - 2)| < 0.01$$

$$|x + 2||x - 2| < 0.01$$

$$|x - 2| < \frac{0.01}{|x + 2|}$$

If you assume $1 < x < 3$, then

$$\delta \approx 0.01/5 = 0.002.$$

So, if $0 < |x - 2| < \delta \approx 0.002$, you have

$$|x - 2| < 0.002 = \frac{1}{5}(0.01) < \frac{1}{|x + 2|}(0.01)$$

$$|x + 2||x - 2| < 0.01$$

$$|x^2 - 4| < 0.01$$

$$|(x^2 - 3) - 1| < 0.01$$

$$|f(x) - L| < 0.01.$$

(b) $|(x^2 - 3) - 1| < 0.005$

$$|x^2 - 4| < 0.005$$

$$|(x + 2)(x - 2)| < 0.005$$

$$|x + 2||x - 2| < 0.005$$

$$|x - 2| < \frac{0.005}{|x + 2|}$$

If you assume $1 < x < 3$, then

$$\delta = \frac{0.005}{5} = 0.001.$$

Finally, as in part (a), if $0 < |x - 2| < 0.001$,

you have $|(x^2 - 3) - 1| < 0.005$.

$$42. \lim_{x \rightarrow 4} (x^2 + 6) = 4^2 + 6 = 22 = L$$

$$(a) \quad |(x^2 + 6) - 22| < 0.01$$

$$|x^2 - 16| < 0.01$$

$$|(x + 4)(x - 4)| < 0.01$$

$$|x + 4||x - 4| < 0.01$$

$$|x - 4| < \frac{0.01}{|x + 4|}$$

If you assume $3 < x < 5$, then

$$\delta = \frac{0.01}{9} \approx 0.00111.$$

So, if $0 < |x - 4| < \delta \approx \frac{0.01}{9}$, you have

$$|x - 4| < \frac{0.01}{9} < \frac{0.01}{|x + 4|}$$

$$|(x + 4)(x - 4)| < 0.01$$

$$|x^2 - 16| < 0.01$$

$$|(x^2 + 6) - 22| < 0.01$$

$$|f(x) - L| < 0.01.$$

$$(b) \quad |(x^2 + 6) - 22| < 0.005$$

$$|x^2 - 16| < 0.005$$

$$|(x - 4)(x + 4)| < 0.005$$

$$|x - 4||x + 4| < 0.005$$

$$|x - 4| < \frac{0.005}{|x + 4|}$$

If you assume $3 < x < 5$, then

$$\delta = \frac{0.005}{9} \approx 0.00056.$$

Finally, as in part (a), if $0 < |x - 4| < \frac{0.005}{9}$,

you have $|(x^2 + 6) - 22| < 0.005$.

$$43. \lim_{x \rightarrow 4} (x^2 - x) = 16 - 4 = 12 = L$$

$$(a) \quad |(x^2 - x) - 12| < 0.01$$

$$|(x - 4)(x + 3)| < 0.01$$

$$|x - 4||x + 3| < 0.01$$

$$|x - 4| < \frac{0.01}{|x + 3|}$$

If you assume $3 < x < 5$, then

$$\delta = \frac{0.01}{8} = 0.00125.$$

So, if $0 < |x - 4| < \frac{0.01}{8}$, you have

$$|x - 4| < \frac{0.01}{|x + 3|}$$

$$|x - 4||x + 3| < 0.01$$

$$|x^2 - x - 12| < 0.01$$

$$|(x^2 - x) - 12| < 0.01$$

$$|f(x) - L| < 0.01$$

$$(b) \quad |(x^2 - x) - 12| < 0.005$$

$$|(x - 4)(x + 3)| < 0.005$$

$$|x - 4||x + 3| < 0.005$$

$$|x - 4| < \frac{0.005}{|x + 3|}$$

If you assume $3 < x < 5$, then

$$\delta = \frac{0.005}{8} = 0.000625.$$

Finally, as in part (a), if $0 < |x - 4| < \frac{0.005}{8}$,

you have $|(x^2 - x) - 12| < 0.005$.

44. $\lim_{x \rightarrow 3} x^2 = 3^2 = 9 = L$

(a) $|x^2 - 9| < 0.01$
 $|(x - 3)(x + 3)| < 0.01$
 $|x - 3||x + 3| < 0.01$
 $|x - 3| < \frac{0.01}{|x + 3|}$

If you assume $2 < x < 4$, then

$$\delta = \frac{0.01}{7} \approx 0.0014.$$

So, if $0 < |x - 3| < \frac{0.01}{7}$, you have

$$|x - 3| < \frac{0.01}{|x + 3|}$$

$$|x - 3||x + 3| < 0.01$$

$$|x^2 - 9| < 0.01$$

$$|f(x) - L| < 0.01$$

(b) $|x^2 - 9| < 0.005$

$$|(x - 3)(x + 3)| < 0.005$$

$$|x - 3||x + 3| < 0.005$$

$$|x - 3| < \frac{0.005}{|x + 3|}$$

If you assume $2 < x < 4$, then

$$\delta = \frac{0.005}{7} \approx 0.00071.$$

Finally, as in part (a), if $0 < |x - 3| < \frac{0.005}{7}$, you

have $|x^2 - 9| < 0.005$.

45. $\lim_{x \rightarrow 4} (x + 2) = 4 + 2 = 6$

Given $\varepsilon > 0$:

$$|(x + 2) - 6| < \varepsilon$$

$$|x - 4| < \varepsilon = \delta$$

So, let $\delta = \varepsilon$. So, if $0 < |x - 4| < \delta = \varepsilon$, you have

$$|x - 4| < \varepsilon$$

$$|(x + 2) - 6| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

46. $\lim_{x \rightarrow -2} (4x + 5) = 4(-2) + 5 = -3$

Given $\varepsilon > 0$:

$$|(4x + 5) - (-3)| < \varepsilon$$

$$|4x + 8| < \varepsilon$$

$$4|x + 2| < \varepsilon$$

$$|x + 2| < \frac{\varepsilon}{4} = \delta$$

So, let $\delta = \frac{\varepsilon}{4}$.

So, if $0 < |x + 2| < \delta = \frac{\varepsilon}{4}$, you have

$$|x + 2| < \frac{\varepsilon}{4}$$

$$|4x + 8| < \varepsilon$$

$$|(4x + 5) - (-3)| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

47. $\lim_{x \rightarrow -4} \left(\frac{1}{2}x - 1\right) = \frac{1}{2}(-4) - 1 = -3$

Given $\varepsilon > 0$:

$$\left|\left(\frac{1}{2}x - 1\right) - (-3)\right| < \varepsilon$$

$$\left|\frac{1}{2}x + 2\right| < \varepsilon$$

$$\frac{1}{2}|x - (-4)| < \varepsilon$$

$$|x - (-4)| < 2\varepsilon$$

So, let $\delta = 2\varepsilon$.

So, if $0 < |x - (-4)| < \delta = 2\varepsilon$, you have

$$|x - (-4)| < 2\varepsilon$$

$$\left|\frac{1}{2}x + 2\right| < \varepsilon$$

$$\left|\left(\frac{1}{2}x - 1\right) + 3\right| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

48. $\lim_{x \rightarrow 3} \left(\frac{3}{4}x + 1\right) = \frac{3}{4}(3) + 1 = \frac{13}{4}$

Given $\varepsilon > 0$:

$$\left|\left(\frac{3}{4}x + 1\right) - \frac{13}{4}\right| < \varepsilon$$

$$\left|\frac{3}{4}x - \frac{9}{4}\right| < \varepsilon$$

$$\frac{3}{4}|x - 3| < \varepsilon$$

$$|x - 3| < \frac{4}{3}\varepsilon$$

So, let $\delta = \frac{4}{3}\varepsilon$.

So, if $0 < |x - 3| < \delta = \frac{4}{3}\varepsilon$, you have

$$|x - 3| < \frac{4}{3}\varepsilon$$

$$\frac{3}{4}|x - 3| < \varepsilon$$

$$\left|\frac{3}{4}x - \frac{9}{4}\right| < \varepsilon$$

$$\left|\left(\frac{3}{4}x + 1\right) - \frac{13}{4}\right| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

49. $\lim_{x \rightarrow 6} 3 = 3$

Given $\varepsilon > 0$:

$$|3 - 3| < \varepsilon$$

$$0 < \varepsilon$$

So, any $\delta > 0$ will work.

So, for any $\delta > 0$, you have

$$|3 - 3| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

50. $\lim_{x \rightarrow 2} (-1) = -1$

$$\text{Given } \varepsilon > 0: |-1 - (-1)| < \varepsilon$$

$$0 < \varepsilon$$

So, any $\delta > 0$ will work.

So, for any $\delta > 0$, you have

$$|(-1) - (-1)| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

51. $\lim_{x \rightarrow 0} \sqrt[3]{x} = 0$

$$\text{Given } \varepsilon > 0: \left|\sqrt[3]{x} - 0\right| < \varepsilon$$

$$\left|\sqrt[3]{x}\right| < \varepsilon$$

$$|x| < \varepsilon^3 = \delta$$

So, let $\delta = \varepsilon^3$.

So, for $0 < |x - 0| < \delta = \varepsilon^3$, you have

$$|x| < \varepsilon^3$$

$$\left|\sqrt[3]{x}\right| < \varepsilon$$

$$\left|\sqrt[3]{x} - 0\right| < \varepsilon$$

$$|f(x) - L| < \varepsilon.$$

52. $\lim_{x \rightarrow 4} \sqrt{x} = \sqrt{4} = 2$

$$\text{Given } \varepsilon > 0: \left|\sqrt{x} - 2\right| < \varepsilon$$

$$\left|\sqrt{x} - 2\right| \left|\sqrt{x} + 2\right| < \varepsilon \left|\sqrt{x} + 2\right|$$

$$|x - 4| < \varepsilon \left|\sqrt{x} + 2\right|$$

Assuming $1 < x < 9$, you can choose $\delta = 3\varepsilon$. Then,

$$0 < |x - 4| < \delta = 3\varepsilon \Rightarrow |x - 4| < \varepsilon \left|\sqrt{x} + 2\right|$$

$$\Rightarrow \left|\sqrt{x} - 2\right| < \varepsilon.$$

53. $\lim_{x \rightarrow -5} |x - 5| = |(-5) - 5| = |-10| = 10$

$$\text{Given } \varepsilon > 0: \left||x - 5| - 10\right| < \varepsilon$$

$$\left|-(x - 5) - 10\right| < \varepsilon \quad (x - 5 < 0)$$

$$|-x - 5| < \varepsilon$$

$$|x - (-5)| < \varepsilon$$

So, let $\delta = \varepsilon$.

So for $|x - (-5)| < \delta = \varepsilon$, you have

$$|-(x + 5)| < \varepsilon$$

$$\left|-(x - 5) - 10\right| < \varepsilon$$

$$\left||x - 5| - 10\right| < \varepsilon \quad (\text{because } x - 5 < 0)$$

$$|f(x) - L| < \varepsilon.$$

54. $\lim_{x \rightarrow 3} |x - 3| = |3 - 3| = 0$

Given $\varepsilon > 0$: $||x - 3| - 0| < \varepsilon$
 $|x - 3| < \varepsilon$

So, let $\delta = \varepsilon$.

So, for $0 < |x - 3| < \delta = \varepsilon$, you have

$|x - 3| < \varepsilon$
 $||x - 3| - 0| < \varepsilon$
 $|f(x) - L| < \varepsilon$.

55. $\lim_{x \rightarrow 1} (x^2 + 1) = 1^2 + 1 = 2$

Given $\varepsilon > 0$: $|(x^2 + 1) - 2| < \varepsilon$
 $|x^2 - 1| < \varepsilon$
 $|(x + 1)(x - 1)| < \varepsilon$
 $|x - 1| < \frac{\varepsilon}{|x + 1|}$

If you assume $0 < x < 2$, then $\delta = \varepsilon/3$.

So for $0 < |x - 1| < \delta = \frac{\varepsilon}{3}$, you have

$|x - 1| < \frac{1}{3}\varepsilon < \frac{1}{|x + 1|}\varepsilon$
 $|x^2 - 1| < \varepsilon$
 $|(x^2 + 1) - 2| < \varepsilon$
 $|f(x) - L| < \varepsilon$.

56. $\lim_{x \rightarrow -4} (x^2 + 4x) = (-4)^2 + 4(-4) = 0$

Given $\varepsilon > 0$: $|(x^2 + 4x) - 0| < \varepsilon$
 $|x(x + 4)| < \varepsilon$
 $|x + 4| < \frac{\varepsilon}{|x|}$

If you assume $-5 < x < -3$, then $\delta = \frac{\varepsilon}{5}$.

So for $0 < |x - (-4)| < \delta = \frac{\varepsilon}{5}$, you have

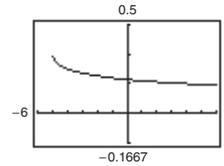

$|x + 4| < \frac{\varepsilon}{5} < \frac{1}{|x|}\varepsilon$
 $|x(x + 4)| < \varepsilon$
 $|(x^2 + 4x) - 0| < \varepsilon$
 $|f(x) - L| < \varepsilon$.

57. $\lim_{x \rightarrow \pi} f(x) = \lim_{x \rightarrow \pi} 4 = 4$

58. $\lim_{x \rightarrow \pi} f(x) = \lim_{x \rightarrow \pi} x = \pi$

59. $f(x) = \frac{\sqrt{x + 5} - 3}{x - 4}$

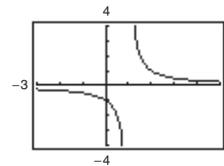

$\lim_{x \rightarrow 4} f(x) = \frac{1}{6}$

The domain is $[-5, 4) \cup (4, \infty)$. The graphing utility does not show the hole at $(4, \frac{1}{6})$.

60. $f(x) = \frac{x - 3}{x^2 - 4x + 3}$

$\lim_{x \rightarrow 3} f(x) = \frac{1}{2}$

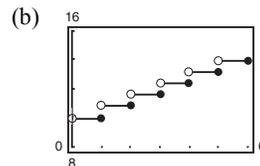

The domain is all $x \neq 1, 3$. The graphing utility does not show the hole at $(3, \frac{1}{2})$.

61. $C(t) = 9.99 - 0.79[1 - t]$, $t > 0$

(a) $C(10.75) = 9.99 - 0.79[1 - 10.75]$
 $= 9.99 - 0.79(-10)$
 $= \$17.89$

$C(10.75)$ represents the cost of a 10-minute, 45-second call.

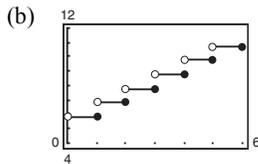

(c) The limit does not exist because the limits from the left and right are not equal.

62. $C(t) = 5.79 - 0.99[1 - t]$, $t > 0$

(a) $C(10.75) = 5.79 - 0.99[1 - 10.75]$
 $= 5.79 - 0.99(-10)$
 $= \$15.69$

$C(10.75)$ represents the cost of a 10-minute, 45-second call.

(c) The limit does not exist because the limits from the left and right are not equal.

63. Choosing a smaller positive value of δ will still satisfy the inequality $|f(x) - L| < \varepsilon$.

64. In the definition of $\lim_{x \rightarrow c} f(x)$, f must be defined on both sides of c , but does not have to be defined at c itself. The value of f at c has no bearing on the limit as x approaches c .

65. No. The fact that $f(2) = 4$ has no bearing on the existence of the limit of $f(x)$ as x approaches 2.

66. No. The fact that $\lim_{x \rightarrow 2} f(x) = 4$ has no bearing on the value of f at 2.

67. (a) $C = 2\pi r$

$$r = \frac{C}{2\pi} = \frac{6}{2\pi} = \frac{3}{\pi} \approx 0.9549 \text{ cm}$$

(b) When $C = 5.5$: $r = \frac{5.5}{2\pi} \approx 0.87535 \text{ cm}$

When $C = 6.5$: $r = \frac{6.5}{2\pi} \approx 1.03451 \text{ cm}$

So $0.87535 < r < 1.03451$.

(c) $\lim_{x \rightarrow 3/\pi} (2\pi r) = 6$; $\varepsilon = 0.5$; $\delta \approx 0.0796$

70. $f(x) = \frac{|x+1| - |x-1|}{x}$

x	-1	-0.5	-0.1	0	0.1	0.5	1.0
$f(x)$	2	2	2	Undef.	2	2	2

$$\lim_{x \rightarrow 0} f(x) = 2$$

Note that for

$$-1 < x < 1, x \neq 0, f(x) = \frac{(x+1) + (x-1)}{x} = 2.$$

68. $V = \frac{4}{3}\pi r^3$, $V = 2.48$

(a) $2.48 = \frac{4}{3}\pi r^3$

$$r^3 = \frac{1.86}{\pi}$$

$$r \approx 0.8397 \text{ in.}$$

(b) $2.45 \leq V \leq 2.51$

$$2.45 \leq \frac{4}{3}\pi r^3 \leq 2.51$$

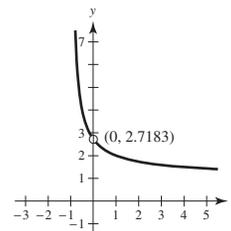

$$0.5849 \leq r^3 \leq 0.5992$$

$$0.8363 \leq r \leq 0.8431$$

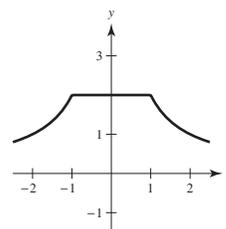

(c) For $\varepsilon = 2.51 - 2.48 = 0.03$, $\delta \approx 0.003$

69. $f(x) = (1+x)^{1/x}$

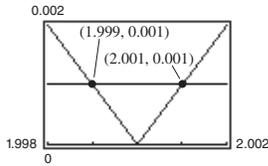

$$\lim_{x \rightarrow 0} (1+x)^{1/x} = e \approx 2.71828$$

x	$f(x)$	x	$f(x)$
-0.1	2.867972	0.1	2.593742
-0.01	2.731999	0.01	2.704814
-0.001	2.719642	0.001	2.716942
-0.0001	2.718418	0.0001	2.718146
-0.00001	2.718295	0.00001	2.718268
-0.000001	2.718283	0.000001	2.718280

71.

Using the zoom and trace feature, $\delta = 0.001$. So $(2 - \delta, 2 + \delta) = (1.999, 2.001)$.

Note: $\frac{x^2 - 4}{x - 2} = x + 2$ for $x \neq 2$.

72. (a) $\lim_{x \rightarrow c} f(x)$ exists for all $c \neq -3$.

(b) $\lim_{x \rightarrow c} f(x)$ exists for all $c \neq -2, 0$.

73. False. The existence or nonexistence of $f(x)$ at $x = c$ has no bearing on the existence of the limit of $f(x)$ as $x \rightarrow c$.

74. True

75. False. Let

$$f(x) = \begin{cases} x - 4, & x \neq 2 \\ 0, & x = 2 \end{cases}$$

$$f(2) = 0$$

$$\lim_{x \rightarrow 2} f(x) = \lim_{x \rightarrow 2} (x - 4) = 2 \neq 0$$

81. If $\lim_{x \rightarrow c} f(x) = L_1$ and $\lim_{x \rightarrow c} f(x) = L_2$, then for every $\varepsilon > 0$, there exists $\delta_1 > 0$ and $\delta_2 > 0$ such that

$|x - c| < \delta_1 \Rightarrow |f(x) - L_1| < \varepsilon$ and $|x - c| < \delta_2 \Rightarrow |f(x) - L_2| < \varepsilon$. Let δ equal the smaller of δ_1 and δ_2 . Then for $|x - c| < \delta$, you have $|L_1 - L_2| = |L_1 - f(x) + f(x) - L_2| \leq |L_1 - f(x)| + |f(x) - L_2| < \varepsilon + \varepsilon$. Therefore, $|L_1 - L_2| < 2\varepsilon$. Since $\varepsilon > 0$ is arbitrary, it follows that $L_1 = L_2$.

82. $f(x) = mx + b$, $m \neq 0$. Let $\varepsilon > 0$ be given.

$$\text{Take } \delta = \frac{\varepsilon}{|m|}.$$

If $0 < |x - c| < \delta = \frac{\varepsilon}{|m|}$, then

$$|m||x - c| < \varepsilon$$

$$|mx - mc| < \varepsilon$$

$$|(mx + b) - (mc + b)| < \varepsilon$$

which shows that $\lim_{x \rightarrow c} (mx + b) = mc + b$.

76. False. Let

$$f(x) = \begin{cases} x - 4, & x \neq 2 \\ 0, & x = 2 \end{cases}$$

$$\lim_{x \rightarrow 2} f(x) = \lim_{x \rightarrow 2} (x - 4) = 2 \text{ and } f(2) = 0 \neq 2$$

77. $f(x) = \sqrt{x}$

$$\lim_{x \rightarrow 0.25} \sqrt{x} = 0.5 \text{ is true.}$$

As x approaches $0.25 = \frac{1}{4}$ from either side,

$$f(x) = \sqrt{x} \text{ approaches } \frac{1}{2} = 0.5.$$

78. $f(x) = \sqrt{x}$

$$\lim_{x \rightarrow 0} \sqrt{x} = 0 \text{ is false.}$$

$f(x) = \sqrt{x}$ is not defined on an open interval containing 0 because the domain of f is $x \geq 0$.

79. Using a graphing utility, you see that

$$\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

$$\lim_{x \rightarrow 0} \frac{\sin 2x}{x} = 2, \text{ etc.}$$

$$\text{So, } \lim_{x \rightarrow 0} \frac{\sin nx}{x} = n.$$

80. Using a graphing utility, you see that

$$\lim_{x \rightarrow 0} \frac{\tan x}{x} = 1$$

$$\lim_{x \rightarrow 0} \frac{\tan 2x}{x} = 2, \text{ etc.}$$

$$\text{So, } \lim_{x \rightarrow 0} \frac{\tan(nx)}{x} = n.$$

83. $\lim_{x \rightarrow c} [f(x) - L] = 0$ means that for every $\varepsilon > 0$

there exists $\delta > 0$ such that if $0 < |x - c| < \delta$,

then

$$|(f(x) - L) - 0| < \varepsilon.$$

This means the same as $|f(x) - L| < \varepsilon$ when

$$0 < |x - c| < \delta.$$

$$\text{So, } \lim_{x \rightarrow c} f(x) = L.$$

$$\begin{aligned} 84. (a) \quad (3x+1)(3x-1)x^2 + 0.01 &= (9x^2-1)x^2 + \frac{1}{100} \\ &= 9x^4 - x^2 + \frac{1}{100} \\ &= \frac{1}{100}(10x^2-1)(90x^2-1) \end{aligned}$$

So, $(3x+1)(3x-1)x^2 + 0.01 > 0$ if

$$10x^2 - 1 < 0 \text{ and } 90x^2 - 1 < 0.$$

$$\text{Let } (a, b) = \left(-\frac{1}{\sqrt{90}}, \frac{1}{\sqrt{90}}\right).$$

For all $x \neq 0$ in (a, b) , the graph is positive.

You can verify this with a graphing utility.

(b) You are given $\lim_{x \rightarrow c} g(x) = L > 0$. Let $\varepsilon = \frac{1}{2}L$.

There exists $\delta > 0$ such that $0 < |x - c| < \delta$

implies that $|g(x) - L| < \varepsilon = \frac{L}{2}$. That is,

$$-\frac{L}{2} < g(x) - L < \frac{L}{2}$$

$$\frac{L}{2} < g(x) < \frac{3L}{2}$$

For x in the interval $(c - \delta, c + \delta)$, $x \neq c$, you

have $g(x) > \frac{L}{2} > 0$, as desired.

85. The radius OP has a length equal to the altitude z of the triangle plus $\frac{h}{2}$. So, $z = 1 - \frac{h}{2}$.

$$\text{Area triangle} = \frac{1}{2}b\left(1 - \frac{h}{2}\right)$$

$$\text{Area rectangle} = bh$$

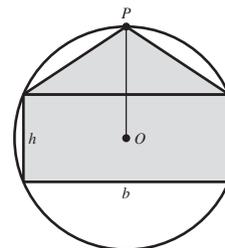

Because these are equal,

$$\frac{1}{2}b\left(1 - \frac{h}{2}\right) = bh$$

$$1 - \frac{h}{2} = 2h$$

$$\frac{5}{2}h = 1$$

$$h = \frac{2}{5}.$$

86. Consider a cross section of the cone, where EF is a diagonal of the inscribed cube. $AD = 3$, $BC = 2$.

Let x be the length of a side of the cube.

Then $EF = x\sqrt{2}$.

By similar triangles,

$$\frac{EF}{BC} = \frac{AG}{AD}$$

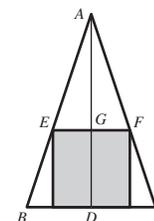

$$\frac{x\sqrt{2}}{2} = \frac{3-x}{3}$$

Solving for x ,

$$3\sqrt{2}x = 6 - 2x$$

$$(3\sqrt{2} + 2)x = 6$$

$$x = \frac{6}{3\sqrt{2} + 2} = \frac{9\sqrt{2} - 6}{7} \approx 0.96.$$

Section 1.3 Evaluating Limits Analytically

1. For polynomial functions $p(x)$, substitute c for x , and simplify.

2. An indeterminate form is obtained when evaluating a limit using direct substitution produces a meaningless fractional expression such as $0/0$. That is,

$$\lim_{x \rightarrow c} \frac{f(x)}{g(x)}$$

for which $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} g(x) = 0$

3. If a function f is squeezed between two functions h and g , $h(x) \leq f(x) \leq g(x)$, and h and g have the same limit

L as $x \rightarrow c$, then $\lim_{x \rightarrow c} f(x)$ exists and equals L

$$4. \lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$$

$$\lim_{x \rightarrow 0} \frac{1 - \cos x}{x} = 0$$

$$5. \lim_{x \rightarrow 2} x^3 = 2^3 = 8$$

$$6. \lim_{x \rightarrow -3} x^4 = (-3)^4 = 81$$

$$7. \lim_{x \rightarrow -3} (2x + 5) = 2(-3) + 5 = -1$$

$$8. \lim_{x \rightarrow 9} (4x - 1) = 4(9) - 1 = 36 - 1 = 35$$

$$9. \lim_{x \rightarrow -3} (x^2 + 3x) = (-3)^2 + 3(-3) = 9 - 9 = 0$$

$$10. \lim_{x \rightarrow 2} (-x^3 + 1) = (-2)^3 + 1 = -8 + 1 = -7$$

$$11. \lim_{x \rightarrow -3} (2x^2 + 4x + 1) = 2(-3)^2 + 4(-3) + 1 \\ = 18 - 12 + 1 = 7$$

$$12. \lim_{x \rightarrow 1} (2x^3 - 6x + 5) = 2(1)^3 - 6(1) + 5 \\ = 2 - 6 + 5 = 1$$

$$13. \lim_{x \rightarrow 3} \sqrt{x + 8} = \sqrt{3 + 8} = \sqrt{11}$$

$$14. \lim_{x \rightarrow 2} \sqrt[3]{12x + 3} = \sqrt[3]{12(2) + 3} \\ = \sqrt[3]{24 + 3} = \sqrt[3]{27} = 3$$

$$15. \lim_{x \rightarrow -4} (1 - x)^3 = [1 - (-4)]^3 = 5^3 = 125$$

$$16. \lim_{x \rightarrow 0} (3x - 2)^4 = (3(0) - 2)^4 = (-2)^4 = 16$$

$$17. \lim_{x \rightarrow 2} \frac{3}{2x + 1} = \frac{3}{2(2) + 1} = \frac{3}{5}$$

$$18. \lim_{x \rightarrow -5} \frac{5}{x + 3} = \frac{5}{-5 + 3} = -\frac{5}{2}$$

$$19. \lim_{x \rightarrow 1} \frac{x}{x^2 + 4} = \frac{1}{1^2 + 4} = \frac{1}{5}$$

$$20. \lim_{x \rightarrow 1} \frac{3x + 5}{x + 1} = \frac{3(1) + 5}{1 + 1} = \frac{3 + 5}{2} = \frac{8}{2} = 4$$

$$21. \lim_{x \rightarrow 7} \frac{3x}{\sqrt{x + 2}} = \frac{3(7)}{\sqrt{7 + 2}} = \frac{21}{3} = 7$$

$$22. \lim_{x \rightarrow 3} \frac{\sqrt{x + 6}}{x + 2} = \frac{\sqrt{3 + 6}}{3 + 2} = \frac{\sqrt{9}}{5} = \frac{3}{5}$$

$$23. (a) \lim_{x \rightarrow 1} f(x) = 5 - 1 = 4$$

$$(b) \lim_{x \rightarrow 4} g(x) = 4^3 = 64$$

$$(c) \lim_{x \rightarrow 1} g(f(x)) = g(f(1)) = g(4) = 64$$

$$37. \lim_{x \rightarrow c} f(x) = \frac{2}{5}, \lim_{x \rightarrow c} g(x) = 2$$

$$(a) \lim_{x \rightarrow c} [5g(x)] = 5 \lim_{x \rightarrow c} g(x) = 5(2) = 10$$

$$(b) \lim_{x \rightarrow c} [f(x) + g(x)] = \lim_{x \rightarrow c} f(x) + \lim_{x \rightarrow c} g(x) = \frac{2}{5} + 2 = \frac{12}{5}$$

$$(c) \lim_{x \rightarrow c} [f(x) + g(x)] = \left[\lim_{x \rightarrow c} f(x) \right] + \left[\lim_{x \rightarrow c} g(x) \right] = \frac{2}{5}(2) = \frac{4}{5}$$

85. $f(x) = x^2 - 4x$

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \lim_{\Delta x \rightarrow 0} \frac{(x + \Delta x)^2 - 4(x + \Delta x) - (x^2 - 4x)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{x^2 + 2x\Delta x + \Delta x^2 - 4x - 4\Delta x - x^2 + 4x}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{\Delta x(2x + \Delta x - 4)}{\Delta x} = \lim_{\Delta x \rightarrow 0} (2x + \Delta x - 4) = 2x - 4 \end{aligned}$$

86. $f(x) = 3x^2 + 1$

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \lim_{\Delta x \rightarrow 0} \frac{[3(x + \Delta x)^2 + 1] - [3x^2 + 1]}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{(3x^2 + 6x\Delta x + 1) - (3x^2 + 1)}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{6x\Delta x}{\Delta x} = \lim_{\Delta x \rightarrow 0} 6x = 6x \end{aligned}$$

87. $f(x) = 2\sqrt{x}$

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \lim_{\Delta x \rightarrow 0} \frac{2\sqrt{x + \Delta x} - 2\sqrt{x}}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{2(\sqrt{x + \Delta x} - \sqrt{x})}{\Delta x} \cdot \frac{\sqrt{x + \Delta x} + \sqrt{x}}{\sqrt{x + \Delta x} + \sqrt{x}} \\ &= \lim_{\Delta x \rightarrow 0} \frac{2(x + \Delta x - x)}{\Delta x(\sqrt{x + \Delta x} + \sqrt{x})} = \lim_{\Delta x \rightarrow 0} \frac{2\Delta x}{\Delta x(\sqrt{x + \Delta x} + \sqrt{x})} \\ &= \lim_{\Delta x \rightarrow 0} \frac{2}{\sqrt{x + \Delta x} + \sqrt{x}} = \frac{2}{2\sqrt{x}} = \frac{1}{\sqrt{x}} = x^{-1/2} \end{aligned}$$

88. $f(x) = \sqrt{x} - 5$

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \lim_{\Delta x \rightarrow 0} \frac{(\sqrt{x + \Delta x} - 5) - (\sqrt{x} - 5)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{\sqrt{x + \Delta x} - \sqrt{x}}{\Delta x} \cdot \frac{\sqrt{x + \Delta x} + \sqrt{x}}{\sqrt{x + \Delta x} + \sqrt{x}} \\ &= \lim_{\Delta x \rightarrow 0} \frac{(x + \Delta x) - x}{\Delta x(\sqrt{x + \Delta x} + \sqrt{x})} = \lim_{\Delta x \rightarrow 0} \frac{\Delta x}{\Delta x(\sqrt{x + \Delta x} + \sqrt{x})} \\ &= \lim_{\Delta x \rightarrow 0} \frac{1}{\sqrt{x + \Delta x} + \sqrt{x}} = \frac{1}{2\sqrt{x}} \end{aligned}$$

89. $f(x) = \frac{1}{x + 3}$

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \lim_{\Delta x \rightarrow 0} \frac{\frac{1}{x + \Delta x + 3} - \frac{1}{x + 3}}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{x + 3 - (x + \Delta x + 3)}{(x + \Delta x + 3)(x + 3)} \cdot \frac{1}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{-\Delta x}{(x + \Delta x + 3)(x + 3)\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{-1}{(x + \Delta x + 3)(x + 3)} = \frac{-1}{(x + 3)^2} \end{aligned}$$

90. $f(x) = \frac{1}{x^2}$

$$\begin{aligned} \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x) - f(x)}{\Delta x} &= \lim_{\Delta x \rightarrow 0} \frac{\frac{1}{(x + \Delta x)^2} - \frac{1}{x^2}}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{x^2 - (x + \Delta x)^2}{x^2(x + \Delta x)^2 \Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{x^2 - [x^2 + 2x\Delta x + (\Delta x)^2]}{x^2(x + \Delta x)^2 \Delta x} = \lim_{\Delta x \rightarrow 0} \frac{-2x\Delta x - (\Delta x)^2}{x^2(x + \Delta x)^2 \Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{-2x - \Delta x}{x^2(x + \Delta x)^2} = \frac{-2x}{x^4} = -\frac{2}{x^3} \end{aligned}$$

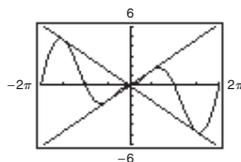

91. $\lim_{x \rightarrow 0} (4 - x^2) \leq \lim_{x \rightarrow 0} f(x) \leq \lim_{x \rightarrow 0} (3 + x^2)$
 $4 \leq \lim_{x \rightarrow 0} f(x) \leq 4$

Therefore, $\lim_{x \rightarrow 0} f(x) = 4$.

92. $\lim_{x \rightarrow a} [b - |x - a|] \leq \lim_{x \rightarrow a} f(x) \leq \lim_{x \rightarrow a} [b + |x - a|]$
 $b \leq \lim_{x \rightarrow a} f(x) \leq b$

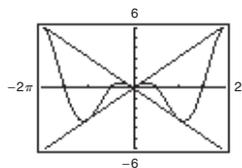

Therefore, $\lim_{x \rightarrow a} f(x) = b$.

93. $f(x) = |x| \sin x$

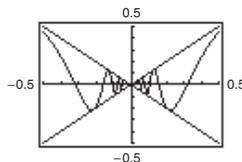

$\lim_{x \rightarrow 0} |x| \sin x = 0$

94. $f(x) = |x| \cos x$

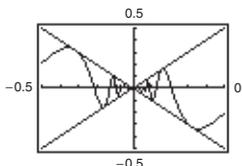

$\lim_{x \rightarrow 0} |x| \cos x = 0$

95. $f(x) = x \sin \frac{1}{x}$

$\lim_{x \rightarrow 0} \left(x \sin \frac{1}{x} \right) = 0$

96. $f(x) = x \cos \frac{1}{x}$

$\lim_{x \rightarrow 0} \left(x \cos \frac{1}{x} \right) = 0$

97. (a) Two functions f and g agree at all but one point (on an open interval) if $f(x) = g(x)$ for all x in the interval except for $x = c$, where c is in the interval.

(b) $f(x) = \frac{x^2 - 1}{x - 1} = \frac{(x + 1)(x - 1)}{x - 1}$ and $g(x) = x + 1$ agree at all points except $x = 1$.

(Other answers possible.)

98. Answers will vary. *Sample answers:*

(a) linear: $f(x) = \frac{1}{2}x$; $\lim_{x \rightarrow 8} \frac{1}{2}x = \frac{1}{2}(8) = 4$

(b) polynomial of degree 2: $f(x) = x^2 - 60$; $\lim_{x \rightarrow 8} (x^2 - 60) = 8^2 - 60 = 4$

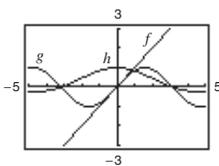

(c) rational: $f(x) = \frac{x}{2x - 14}$; $\lim_{x \rightarrow 8} \frac{x}{2x - 14} = \frac{8}{2(8) - 14} = \frac{8}{2} = 4$

(d) radical: $f(x) = \sqrt{x + 8}$; $\lim_{x \rightarrow 8} \sqrt{x + 8} = \sqrt{8 + 8} = \sqrt{16} = 4$

(e) cosine: $f(x) = 4 \cos(\pi x)$; $\lim_{x \rightarrow 8} 4 \cos(\pi x) = 4 \cos(8\pi) = 4(1) = 4$

(f) sine: $f(x) = 4 \sin\left(\frac{\pi}{16}x\right)$; $\lim_{x \rightarrow 8} 4 \sin\left(\frac{\pi}{16}x\right) = 4 \sin\left(\frac{\pi}{2}\right) = 4(1) = 4$

99. $f(x) = x, g(x) = \sin x, h(x) = \frac{\sin x}{x}$

When the x -values are “close to” 0 the magnitude of f is approximately equal to the magnitude of g . So, $|g|/|f| \approx 1$ when x is “close to” 0.

100. (a) Use the dividing out technique because the numerator and denominator have a common factor.
 (b) Use the rationalizing technique because the numerator involves a radical expression.

102. $s(t) = -16t^2 + 500 = 0$ when $t = \sqrt{\frac{500}{16}} = \frac{5\sqrt{5}}{2}$ sec. The velocity at time $a = \frac{5\sqrt{5}}{2}$ is

$$\begin{aligned} \lim_{t \rightarrow \left(\frac{5\sqrt{5}}{2}\right)} \frac{s\left(\frac{5\sqrt{5}}{2}\right) - s(t)}{\frac{5\sqrt{5}}{2} - t} &= \lim_{t \rightarrow \left(\frac{5\sqrt{5}}{2}\right)} \frac{0 - (-16t^2 + 500)}{\frac{5\sqrt{5}}{2} - t} \\ &= \lim_{t \rightarrow \left(\frac{5\sqrt{5}}{2}\right)} \frac{16\left(t^2 - \frac{125}{4}\right)}{\frac{5\sqrt{5}}{2} - t} \\ &= \lim_{t \rightarrow \left(\frac{5\sqrt{5}}{2}\right)} \frac{16\left(t + \frac{5\sqrt{5}}{2}\right)\left(t - \frac{5\sqrt{5}}{2}\right)}{\frac{5\sqrt{5}}{2} - t} \\ &= \lim_{t \rightarrow \frac{5\sqrt{5}}{2}} \left[-16\left(t + \frac{5\sqrt{5}}{2}\right)\right] = -80\sqrt{5} \text{ ft/sec} \\ &\approx -178.9 \text{ ft/sec.} \end{aligned}$$

The velocity of the paint can when it hits the ground is about 178.9 ft/sec.

103. $s(t) = -4.9t^2 + 200$

$$\begin{aligned} \lim_{t \rightarrow 3} \frac{s(3) - s(t)}{3 - t} &= \lim_{t \rightarrow 3} \frac{-4.9(3)^2 + 200 - (-4.9t^2 + 200)}{3 - t} \\ &= \lim_{t \rightarrow 3} \frac{4.9(t^2 - 9)}{3 - t} \\ &= \lim_{t \rightarrow 3} \frac{4.9(t - 3)(t + 3)}{3 - t} \\ &= \lim_{t \rightarrow 3} [-4.9(t + 3)] \\ &= -29.4 \text{ m/sec} \end{aligned}$$

The object is falling about 29.4 m/sec.

101. $s(t) = -16t^2 + 500$

$$\begin{aligned} \lim_{t \rightarrow 2} \frac{s(2) - s(t)}{2 - t} &= \lim_{t \rightarrow 2} \frac{-16(2)^2 + 500 - (-16t^2 + 500)}{2 - t} \\ &= \lim_{t \rightarrow 2} \frac{436 + 16t^2 - 500}{2 - t} \\ &= \lim_{t \rightarrow 2} \frac{16(t^2 - 4)}{2 - t} \\ &= \lim_{t \rightarrow 2} \frac{16(t - 2)(t + 2)}{2 - t} \\ &= \lim_{t \rightarrow 2} -16(t + 2) = -64 \text{ ft/sec} \end{aligned}$$

The paint can is falling at about 64 feet/second.

104. $-4.9t^2 + 200 = 0$ when $t = \sqrt{\frac{200}{4.9}} = \frac{20\sqrt{5}}{7}$ sec. The velocity at time $a = \frac{20\sqrt{5}}{7}$ is

$$\begin{aligned} \lim_{t \rightarrow a} \frac{s(a) - s(t)}{a - t} &= \lim_{t \rightarrow a} \frac{0 - [-4.9t^2 + 200]}{a - t} \\ &= \lim_{t \rightarrow a} \frac{4.9(t + a)(t - a)}{a - t} \\ &= \lim_{t \rightarrow \frac{20\sqrt{5}}{7}} \left[-4.9 \left(t + \frac{20\sqrt{5}}{7} \right) \right] = -28\sqrt{5} \text{ m/sec} \\ &\approx -62.6 \text{ m/sec.} \end{aligned}$$

The velocity of the object when it hits the ground is about 62.6 m/sec.

105. Let $f(x) = 1/x$ and $g(x) = -1/x$. $\lim_{x \rightarrow 0} f(x)$ and $\lim_{x \rightarrow 0} g(x)$ do not exist. However,

$$\lim_{x \rightarrow 0} [f(x) + g(x)] = \lim_{x \rightarrow 0} \left[\frac{1}{x} + \left(-\frac{1}{x} \right) \right] = \lim_{x \rightarrow 0} [0] = 0 \text{ and therefore does not exist.}$$

106. Suppose, on the contrary, that $\lim_{x \rightarrow c} g(x)$ exists. Then,

because $\lim_{x \rightarrow c} f(x)$ exists, so would $\lim_{x \rightarrow c} [f(x) + g(x)]$, which is a contradiction. So, $\lim_{x \rightarrow c} g(x)$ does not exist.

107. Given $f(x) = b$, show that for every $\varepsilon > 0$ there exists

a $\delta > 0$ such that $|f(x) - b| < \varepsilon$ whenever $|x - c| < \delta$. Because $|f(x) - b| = |b - b| = 0 < \varepsilon$ for every $\varepsilon > 0$, any value of $\delta > 0$ will work.

108. Given $f(x) = x^n$, n is a positive integer, then

$$\begin{aligned} \lim_{x \rightarrow c} x^n &= \lim_{x \rightarrow c} (xx^{n-1}) \\ &= \left[\lim_{x \rightarrow c} x \right] \left[\lim_{x \rightarrow c} x^{n-1} \right] = c \left[\lim_{x \rightarrow c} (xx^{n-2}) \right] \\ &= c \left[\lim_{x \rightarrow c} x \right] \left[\lim_{x \rightarrow c} x^{n-2} \right] = c(c) \lim_{x \rightarrow c} (xx^{n-3}) \\ &= \dots = c^n. \end{aligned}$$

109. If $b = 0$, the property is true because both sides are equal to 0. If $b \neq 0$, let $\varepsilon > 0$ be given. Because

$\lim_{x \rightarrow c} f(x) = L$, there exists $\delta > 0$ such that $|f(x) - L| < \varepsilon/|b|$ whenever $0 < |x - c| < \delta$. So, whenever $0 < |x - c| < \delta$, we have

$$|b||f(x) - L| < \varepsilon \quad \text{or} \quad |bf(x) - bL| < \varepsilon$$

which implies that $\lim_{x \rightarrow c} [bf(x)] = bL$.

110. Given $\lim_{x \rightarrow c} f(x) = 0$:

For every $\varepsilon > 0$, there exists $\delta > 0$ such that

$$|f(x) - 0| < \varepsilon \text{ whenever } 0 < |x - c| < \delta.$$

Now $|f(x) - 0| = |f(x)| = \left| \frac{f(x)}{1} - 0 \right| < \varepsilon$ for

$$|x - c| < \delta. \text{ Therefore, } \lim_{x \rightarrow c} |f(x)| = 0.$$

111.
$$\begin{aligned} -M|f(x)| &\leq f(x)g(x) \leq M|f(x)| \\ \lim_{x \rightarrow c} (-M|f(x)|) &\leq \lim_{x \rightarrow c} [f(x)g(x)] \leq \lim_{x \rightarrow c} (M|f(x)|) \\ -M(0) &\leq \lim_{x \rightarrow c} [f(x)g(x)] \leq M(0) \\ 0 &\leq \lim_{x \rightarrow c} [f(x)g(x)] \leq 0 \end{aligned}$$

Therefore, $\lim_{x \rightarrow c} [f(x)g(x)] = 0$.

112. (a) If $\lim_{x \rightarrow c} |f(x)| = 0$, then $\lim_{x \rightarrow c} [-|f(x)|] = 0$.

$$-|f(x)| \leq f(x) \leq |f(x)|$$

$$\lim_{x \rightarrow c} [-|f(x)|] \leq \lim_{x \rightarrow c} f(x) \leq \lim_{x \rightarrow c} |f(x)|$$

$$0 \leq \lim_{x \rightarrow c} f(x) \leq 0$$

Therefore, $\lim_{x \rightarrow c} f(x) = 0$.

(b) Given $\lim_{x \rightarrow c} f(x) = L$:

For every $\varepsilon > 0$, there exists $\delta > 0$ such that

$$|f(x) - L| < \varepsilon \text{ whenever } 0 < |x - c| < \delta. \text{ Since}$$

$$\left| |f(x)| - |L| \right| \leq |f(x) - L| < \varepsilon \text{ for } |x - c| < \delta,$$

then $\lim_{x \rightarrow c} |f(x)| = |L|$.
