6.
(a) $x_{1}+2 x_{2}=3$
$4 x_{1}+5 x_{2}=6$
(b) $\begin{aligned} 7 x_{1}+9 x_{2}= & 8 \\ 6 x_{1}+4 x_{2} & =-3\end{aligned}$

(a) $\left[\begin{array}{rrrr}1 & 3 & -2 & 0 \\ 1 & 2 & -3 & 6 \\ 8 & 3 & 2 & 5\end{array}\right]$
(b) $\left[\begin{array}{rrrr}2 & 7 & 5 & 1 \\ 0 & -8 & 4 & 3 \\ 3 & -5 & 8 & 9\end{array}\right]$

8. (a) Create zeros below the leading 1 in the first column.
$\mathrm{x}_{1}$ is eliminated from all equations except the first.
(b) Normalize the (2,2) element, i.e., make the ( 2,2 ) element 1 . This becomes a leading 1 . It is now possible to have $\mathrm{x}_{2}$ in the second equation with coefficient 1 .
(c) Need to have the leading 1 in row 2 to the left of leading 1 in row 3.

The second equation now contains an $\mathrm{x}_{2}$ term.
(d) Create zeros above and below the leading 1 in row 2.
$\mathrm{x}_{2}$ is eliminated from all equations except the second.
9. (a) Create zeros above the leading 1 in column 3.
$x_{3}$ is eliminated from all equations except the third.
(b) Need to have the leading 1 in row 1 to the left of leading 1 s in other rows. It is now possible to have $x_{1}$ in Equation 1 with leading coefficient 1 .
(c) Normalize the $(3,3)$ element, i.e., make the $(3,3)$ element 1 . This becomes a leading 1. The coefficient of $x_{3}$ in the third equation becomes 1 .
(d) Create zeros above the leading 1 in column 3.
$\mathrm{x}_{3}$ is eliminated from all equations except the third.

so the solution is $x_{1}=2$ and $x_{2}=5$.
(b) $\left.\left\lfloor\begin{array}{lll}2 & 2 & 4 \\ 3 & 2 & 3\end{array}\right\rfloor \underset{(1 / 2) R 1}{\approx} \underset{ }{\approx}\left\lfloor\begin{array}{lll}1 & 1 & 2 \\ 3 & 2 & 3\end{array}\right\rfloor \underset{R 2+(-3) R 1}{\approx}\left\lfloor\begin{array}{ccc}1 & 1 & 2 \\ 0 & -1 & -3\end{array}\right\rfloor \underset{(-1) R 2}{\approx} \underset{ }{\approx} \begin{array}{lll}1 & 1 & 2 \\ 0 & 1 & 3\end{array}\right\rfloor$ $\underset{R 1+(-1) R 2}{\approx} \quad\left|\begin{array}{ccc}1 & 0 & -1 \\ 0 & 1 & 3\end{array}\right|$, so the solution is $\mathrm{x}_{1}=-1, \mathrm{x}_{2}=3$.
(c) $\left\lfloor\begin{array}{cccc}1 & 0 & 1 & 3 \\ 0 & 2 & -2 & -4 \\ 0 & 1 & -2 & 5\end{array} \left\lvert\, \underset{(1 / 2) R 2}{\approx}\left\lfloor\begin{array}{cccc}1 & 0 & 1 & 3 \\ 0 & 1 & -1 & -2 \\ 0 & 1 & -2 & 5\end{array}\right\rfloor \underset{R 3+(-1) R 2}{\approx} \underset{(c c c c}{1} \begin{array}{ccc}0 & 1 & 3 \\ 0 & 1 & -1 \\ 0 & -2 \\ 0 & 0 & -1\end{array}\right.\right]$
$\left.\underset{(-1) R 3}{\approx}\left[\begin{array}{cccc}1 & 0 & 1 & 3 \\ 0 & 1 & -1 & -2 \\ 0 & 0 & 1 & -7\end{array}\right\rfloor \begin{array}{c}\underset{R 1+(-1) R 3}{ } R 2+R 3\end{array} \begin{array}{cccc}1 & 0 & 0 & 10 \\ 0 & 1 & 0 & -9 \\ 0 & 0 & 1 & -7\end{array}\right]$,
so the solution is $x_{1}=10, x_{2}=-9, x_{3}=-7$.

$$

$$
\left.\underset{(1 / 5) R 3}{\approx}\left\lfloor\begin{array}{ccrr}

$$

so the solution is $x_{1}=1, x_{2}=4, x_{3}=2$.
(f) $\left.\left.\left\lfloor\begin{array}{cccc}-1 & 1 & -1 & -2 \\ 3 & 1 & 1 & 10 \\ 4 & 2 & 3 & 14\end{array}\right\rfloor \underset{(-1) R 1}{\approx}\left\lfloor\begin{array}{cccc}1 & -1 & 1 & 2 \\ 3 & 1 & 1 & 10 \\ 4 & 2 & 3 & 14\end{array}\right\rfloor \underset{~}{\text { R2 }} \begin{array}{c}(-3) R 1 \\ R 3+(-4) R 1\end{array} \right\rvert\, \begin{array}{cccc}1 & -1 & 1 & 2 \\ 0 & 4 & -2 & 4 \\ 0 & 6 & -1 & 6\end{array}\right\rfloor$

11. (a) $\left.\left.\left.\left\lfloor\begin{array}{cccc}1 & 2 & 3 & 14 \\ 2 & 5 & 8 & 36 \\ 1 & -1 & 0 & -4\end{array}\right\rfloor \xrightarrow[R 2+\underset{(-2) R 1}{\approx}]{R 3+(-1) R 1} \right\rvert\, \begin{array}{cccc}1 & 2 & 3 & 14 \\ 0 & 1 & 2 & 8 \\ 0 & -3 & -3 & -18\end{array}\right\rfloor \xrightarrow[R 1+(-2) R 2]{R 3+(3) R 2} \left\lvert\, \begin{array}{cccc}1 & 0 & -1 & -2 \\ 0 & 1 & 2 & 8 \\ 0 & 0 & 3 & 6\end{array}\right.\right\rfloor$ $\underset{(1 / 3) R 3}{\approx}\left\lfloor\begin{array}{cccc}1 & 0 & -1 & -2 \\ 0 & 1 & 2 & 8 \\ 0 & 0 & 1 & 2\end{array}\right\rfloor \underset{R 2+(-2) R 3}{R 1+R 3}\left\lfloor\begin{array}{cccc}1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 4 \\ 0 & 0 & 1 & 2\end{array}\right\rfloor$,
so the solution is $x_{1}=0, x_{2}=4, x_{3}=2$.
(b) $\left.\left.\left\lfloor\begin{array}{cccc}1 & -1 & -1 & -1 \\ -2 & 6 & 10 & 14 \\ 2 & 1 & 6 & 9\end{array}|\underset{R 2+(2) R 1}{R 3+(-2) R 1} \underset{ }{\approx}| \begin{array}{cccc}1 & -1 & -1 & -1 \\ 0 & 4 & 8 & 12 \\ 0 & 3 & 8 & 11\end{array}\right] \underset{(1 / 4) R 2}{\approx} \right\rvert\, \begin{array}{cccc}1 & -1 & -1 & -1 \\ 0 & 1 & 2 & 3 \\ 0 & 3 & 8 & 11\end{array}\right]$
$\underset{\sim}{R 1+R 2} \underset{R 3+(-3) R 2}{\approx}\left\lfloor\begin{array}{llll}1 & 0 & 1 & 2 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 2 & 2\end{array}\right\rfloor \underset{(1 / 2) R 3}{\approx}\left\lfloor\left\lfloor\begin{array}{llll}1 & 0 & 1 & 2 \\ 0 & 1 & 2 & 3 \\ 0 & 0 & 1 & 1\end{array}\right\rfloor \underset{R 1+(-1) R 3}{R 2+(-2) R 3} \begin{array}{|cccc}1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1\end{array}\right\rfloor$,
so the solution is $x_{1}=1, x_{2}=1, x_{3}=1$.
(c) $\left\lfloor\begin{array}{cccc}2 & 2 & -4 & 14 \\ 3 & 1 & 1 & 8 \\ 2 & -1 & 2 & -1\end{array} \left\lvert\, \underset{(1 / 2) R 1}{\approx}\left\lfloor\begin{array}{cccc}1 & 1 & -2 & 7 \\ 3 & 1 & 1 & 8 \\ 2 & -1 & 2 & -1\end{array}\left|\begin{array}{ccc}R 2+(-3) R 1 \\ R 3+(-2) R 1\end{array}\right| \begin{array}{cccc}1 & 1 & -2 & 7 \\ 0 & -2 & 7 & -13 \\ 0 & -3 & 6 & -15\end{array}\right]\right.\right.$

Let us swap rows 2 and rows 2 and 3 to avoid awkward fractions at the next step.

$$

so the solution is $x_{1}=2, x_{2}=3, x_{3}=-1$.

## Exercise Set 1.2

1. (a) Yes. (b) Yes.
(c) No. The second column contains a leading 1, so other elements in that column should be zero.
(d) No. The second row does not have 1 as the first nonzero number.
(e) Yes. (f) Yes. (g) Yes.
(h) No. The second row does not have 1 as the first nonzero number. (i) Yes.
2. (a) No. The leading 1 in row 3 is not to the right of the leading 1 in row 2.
(b) Yes. (c) Yes.
(d) No. The fourth and fifth columns contain leading 1 s , so the other numbers in those columns should be zeros.
(e) No. The row containing all zeros should be at the bottom of the matrix.
(f) Yes.
(g) No. The leading 1 in row 3 is not to the right of the leading 1 in row 2. Also, since column 3 contains a leading 1, all other numbers in that column should be zero.
(h) No. The leading 1 in row 3 is not to the right of the leading 1 s in rows 1 and 2.
(i) Yes.
3. (a) $x_{1}=2, x_{2}=4, x_{3}=-3$.
(b) $x_{1}=3 r+4, x_{2}=-2 r+8, x_{3}=r$.
(c) $x_{1}=-3 r+6, x_{2}=r, x_{3}=-2$. (d) There is no solution. The last row gives $0=1$.
(e) $x_{1}=-5 r+3, x_{2}=-6 r-2, x_{3}=-2 r-4, x_{4}=r$.
(f) $x_{1}=-3 r+2, x_{2}=r, x_{3}=4, x_{4}=5$.

(b) $x_{1}=3 r-2 s+4, x_{2}=r, x_{3}=s, x_{4}=-7$.
(c) $x_{1}=2 r-3 s+4, x_{2}=r, x_{3}=-2 s+9, x_{4}=s, x_{5}=8$.

$$

so the solution is $x_{1}=-1, x_{2}=2, x_{3}=3$.
(c) $\left.\left.\left\lfloor\begin{array}{cccc}1 & 1 & 1 & 7 \\ 2 & 3 & 1 & 18 \\ -1 & 1 & -3 & 1\end{array}\right\rfloor \underset{R 2+\underset{(-2) R 1}{\approx}}{R 3+R 1} \right\rvert\, \begin{array}{cccc}1 & 1 & 1 & 7 \\ 0 & 1 & -1 & 4 \\ 0 & 2 & -2 & 8\end{array}\right\rfloor \underset{R 1+(-1) R 2}{R 3+(-2) R 3}\left\lfloor\begin{array}{cccc}1 & 0 & 2 & 3 \\ 0 & 1 & -1 & 4 \\ 0 & 0 & 0 & 0\end{array}\right\rfloor$,
so $x_{1}+2 x_{3}=3$ and $x_{2}-x_{3}=4$.
Thus the general solution is $x_{1}=3-2 r, x_{2}=4+r, x_{3}=r$.
 $\begin{gathered}\underset{\sim}{\approx}+(-4) R 2 \\ R 3+(2) R 2\end{gathered}\left|\begin{array}{cccc}1 & 0 & -3 & -2 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 0 & 1\end{array}\right|$, so there is no solution, since the last row of the
matrix corresponds to the equation $0=1$.
(e) $\left.\left.\left\lfloor\begin{array}{cccc}1 & -1 & 1 & 3 \\ 2 & -1 & 4 & 7 \\ 3 & -5 & -1 & 7\end{array}\right\rfloor \underset{R 2+(-2) R 1}{R 3+(-3) R 1} \begin{array}{|cccc}\approx & -1 & 1 & 3 \\ 0 & 1 & 2 & 1 \\ 0 & -2 & -4 & -2\end{array}\right\rfloor \underset{R 1+R 2}{R 3+(2) R 2} \begin{array}{cccc}\approx\end{array} \begin{array}{llll}1 & 0 & 3 & 4 \\ 0 & 1 & 2 & 1 \\ 0 & 0 & 0 & 0\end{array}\right\rfloor$, so $x_{1}+3 x_{3}=4$ and $x_{2}+2 x_{3}=1$.
Thus the general solution is $x_{1}=4-3 r, x_{2}=1-2 r, x_{3}=r$.
(f) $\left\lfloor\begin{array}{cccc}3 & -3 & 9 & 24 \\ 2 & -2 & 7 & 17 \\ -1 & 2 & -4 & -11\end{array}\right] \underset{(1 / 3) R 1}{\approx}\left[\begin{array}{cccc}1 & -1 & 3 & 8 \\ 2 & -2 & 7 & 17 \\ -1 & 2 & -4 & -11\end{array}\right] \underset{R 2+(-2) R 1}{R 2+R 1}\left[\begin{array}{cccc}1 & -1 & 3 & 8 \\ 0 & 0 & 1 & 1 \\ 0 & 1 & -1 & -3\end{array}\right]$

so the solution is $x_{1}=3, x_{2}=-2, x_{3}=1$.
6. (a) $\left[\begin{array}{cccc}3 & 6 & -3 & 6 \\ -2 & -4 & -3 & -1 \\ 3 & 6 & -2 & 10\end{array}|\underset{(1 / 3) R 1}{\approx}| \begin{array}{cccc}1 & 2 & -1 & 2 \\ -2 & -4 & -3 & -1 \\ 3 & 6 & -2 & 10\end{array}|\underset{R 2+(-3) R 1}{\approx} \underset{R 1}{\approx}| \begin{array}{cccc}1 & 2 & -1 & 2 \\ 0 & 0 & -5 & 3 \\ 0 & 0 & 1 & 4\end{array}\right]$

It is now clear that there is no solution. The last two rows give $-5 x_{3}=3$ and $x_{3}=$ 4.
 so $x_{1}+2 x_{2}=3$ and $x_{3}=4$. Thus the general solution is $x_{1}=3-2 r, \quad x_{2}=r, x_{3}=4$.

Thus the general solution is $x_{1}=1-2 r, x_{2}=r, x_{3}=-2$.

9. (a) The system of equations

$$
\begin{aligned}
& 3 x_{1}+2 x_{2}-x_{3}+x_{4}=4 \\
& 3 x_{1}+2 x_{2}-x_{3}+x_{4}=1
\end{aligned}
$$

clearly has no solution, since the equations are inconsistent. To make a system that is less obvious, add another equation to the system and perform an elementary transformation on this new system of three equations. For example, replace the second equation by the sum of the second equation and some multiple ( 2 in the example below) of the third equation:

$$
\begin{aligned}
3 x_{1}+2 x_{2}-x_{3}+x_{4} & =4 \\
5 x_{1}+4 x_{2}-x_{3}-x_{4} & =1 \\
x_{1}+x_{2}-x_{4} & =0
\end{aligned}
$$

(b) Choose a solution, e.g., $x_{1}=1, x_{2}=2$. Now make up equations thinking of $x_{1}$ as 1 and $x_{2}$ as 2:

$$
\begin{aligned}
& x_{1}+x_{2}=3 \\
& x_{1}+2 x_{2}=5 \\
& x_{1}-2 x_{2}=-3
\end{aligned}
$$

An easy way to ensure that there are no additional solutions is to include $\mathrm{x}_{1}=1$ or $\mathrm{x}_{2}=2$ as an equation in the system.
10.

11. (a) If $a x_{0}+b y_{0}=0$ then $k\left(a x_{0}+b y_{0}\right)=0$ so that $a\left(k x_{0}\right)+b\left(k y_{0}\right)=0$. Thus $x=k x_{0}, y=k y_{0}$ is a solution. Likewise for the equation $c x+d y=0$.
(b) If $a x_{0}+b y_{0}=0$ and $a x_{1}+b y_{1}=0$ then $a x_{0}+b y_{0}+a x_{1}+b y_{1}=0+0=0$. But $a x_{0}+b y_{0}+a x_{1}+b y_{1}=a x_{0}+a x_{1}+b y_{0}+b y_{1}=a\left(x_{0}+x_{1}\right)+b\left(y_{0}+y_{1}\right)$ so that $a\left(x_{0}+x_{1}\right)+b\left(y_{0}+y_{1}\right)=0$. Thus $x=x_{0}+x_{1}, y=y_{0}+y_{1}$ is a solution. Likewise for the equation $c x+d y=0$.
12. $a(0)+b(0)=0$ and $c(0)+d(0)=0$, so $x=0, y=0$ is a solution.

Multiply $1^{\text {st }}$ equation by $c, 2^{\text {nd }}$ by a to eliminate x. Get $c a x+c b y=0$ and $a c x+a d y=0$. Subtract, ady-cby=0, (ad-bc)y=0. Similarly (ad-bc)x=0. If $a d-b c \neq 0, x=0, y=0$. If $a d-b c=0$ the $x$ and $y$ can be anything; thus many solutions. Therefore $x=0, y=0$ is the only solution if and only if ad- $b c \neq 0$.
13. (a) and (b), No. If the first system of equations has a unique solution, then the reduced echelon form of the matrix $\left[A: B_{1}\right]$ will be $\left[I_{3}: X\right]$. The reduced echelon form of $\left[A: B_{2}\right.$ ] must therefore be $\left[I_{3}: Y\right]$. So the second system must also have a unique solution.
(c) If the first system of equations has many solutions, then at least one row of the reduced echelon form of $\left[A: B_{1}\right]$ will consist entirely of zeros. Therefore the corresponding row(s) of the reduced echelon form of $\left[A: B_{2}\right]$ will have zeros in the first three columns. If any such row has a nonzero number in the fourth column, the system will have no solution.

so the general solution to the first system is $x_{1}=-1-2 r, x_{2}=3-3 r, x_{3}=r$, and the general solution to the second system is $x_{1}=4-2 r, x_{2}=-1-3 r, x_{3}=r$.

\end{array}\right.\right] \text {, so the general solution to the first system is }
$$

15. A $3 \times 3$ matrix represents the equations of three lines in a plane. In order for there to be a unique solution, the three lines would have to meet in a point. For there to be many solutions, the three lines would all have to be the same. It is far more likely that the lines will meet in pairs (or that one pair will be parallel), i.e., that there will be no solution, the situation represented by the reduced echelon form $\mathrm{I}_{3}$.
16. A $3 x 4$ matrix represents the equations of three planes. In order for there to be many solutions, the three planes must have at least one line in common. For there to be no solutions, either at least two of the three planes must be parallel or the line of intersection of two of the planes must lie in a plane that is parallel to the third plane. It is more likely that the three planes will meet in a single point, i.e., that there will be a unique solution. The reduced echelon form therefore will be $\left[I_{3}: X\right]$.
17. The difference between no solution and at least one solution is the presence of a nonzero number in the last position of a row that otherwise consists entirely of zeros. Round-off error is more likely to produce a nonzero number when there should be a zero than the reverse. Thus the answer is (b). Thinking geometrically, a small move by one or more of the linear surfaces (round-off error) may destroy a solution if there is one, but probably won't produce a solution if there is none.
